

Amended Claims:

Please amend the following claims as indicated.

1. (Twice Amended) A form with integrated label comprising:
 - a form layer having top and bottom surfaces and a periphery;
 - at least one die cut through the top and bottom surfaces within the periphery of the form layer, defining at least one portion of the form layer within the die cut;
 - a patch layer, having a periphery and top and bottom surfaces;
 - a layer of repositionable, peelable adhesive wherein the bottom surface of the patch layer is adhesively but removably secured to the top surface of the form layer over the entire die cut and the entire form layer portion;
 - the patch layer, adhesive layer and form layer portion comprising an integrated label;
 - and
 - wherein the adhesive layer has a greater affinity for the bottom surface of the patch layer than the top surface of the form layer such that when the label is removed from the form, the portion of the adhesive layer that is not between the patch layer and the form layer portion is exposed and stays adhered to the bottom surface of the patch layer, and
 - wherein said form and said integrated label are void of releasing agents.
2. (Twice Amended) The form with integrated label of Claim 1 wherein at least the top surface of the patch layer and the top and bottom surfaces of the form layer are [adapted to accept printed indicia thereon] printable.
12. (Twice Amended) A form with integrated fold-over card intermediate comprising:
 - a form layer having top and bottom surfaces and a periphery;
 - at least one die cut through the top and bottom surfaces of the form layer within the periphery of the form layer defining at least one portion of the form layer within the die cut;
 - a patch layer, having first and second halves, a periphery and top and bottom surfaces;

a layer of repositionable, peelable adhesive wherein the bottom surface of the first half of the patch layer is adhesively but removably secured to the top surface of the form layer over the entire die cut and the entire form layer portion;

the bottom surface of the second half of the patch layer being secured to the top surface of the form layer by the adhesive layer over neither the die cut nor the form layer portion;

the patch layer, adhesive layer and form layer portion comprising the fold-over card intermediate;

wherein the adhesive layer has a greater affinity for the bottom surface of the patch layer than the top surface of the form layer such that when the fold-over card intermediate is removed from the form layer, the portion of the adhesive layer that is not between the patch layer and the form layer portion is exposed and stays adhered to the bottom surface of the patch layer;

wherein said form and said integrated label are void of releasing agents; and

wherein once removed from the form layer, the fold-over card intermediate can be folded in half, thus securing the first half and second half of the patch layer together by the adhesive layer and enclosing the form layer portion between the folded halves of the patch layer.

15. (Twice Amended) The form with integrated fold-over card intermediate of Claim 12 or 13 wherein at least the top and bottom surfaces of the form layer and the top surface of the patch layer are [adapted to accept printed indicia thereon] printable.

Added Claims:

Please add the following claims.

25. A form with integrated fold-over card intermediate comprising:
- a form layer having top and bottom surfaces and a periphery;

C1

C1
(cont.)

a first die cut through the top and bottom surfaces of the form layer within the periphery of the form layer defining a first portion of the form layer within the die cut;

a second die cut through the top and bottom surfaces of the form layer within the periphery of the form layer defining a second portion of the form layer within the die cut;

a patch layer, having first and second halves, a periphery and top and bottom surfaces;

a layer of repositionable, peelable adhesive wherein the bottom surface of the first half of the patch layer is adhesively but removably secured to the top surface of the form layer over the entire first die cut and the entire first form layer portion and wherein the bottom surface of the second half of the patch layer is adhesively but removably secured to the top surface of the form layer over the entire second die cut and the entire second form layer portion;

the patch layer, adhesive layer and two form layer portions comprising the fold-over card intermediate;

wherein the adhesive layer has a greater affinity for the bottom surface of the patch layer than the top surface of the form layer such that when the fold-over card intermediate is removed from the form layer, the portion of the adhesive layer that is not between the patch layer and the first and second form layer portions are exposed and stay adhered to the bottom surface of the patch layer;

wherein once removed from the form layer, the fold-over card intermediate can be folded in half, thus securing the first half and second half of the patch layer together by the adhesive layer and enclosing the first and second form layer portions between the folded halves of the patch layer.

26. The form with integrated fold-over card intermediate of Claim 25 further comprising:

an area of exposed adhesive attached to the patch layer within the card intermediate defined by a die cut within at least one of the form layer portions, the die cut defining a section of the form layer removable from the card intermediate;

wherein the section of form layer is removable by peeling the section from the adhesive layer thereby creating the exposed area of the adhesive layer; and

wherein the die cut is of a predetermined size and shape sufficient to make the area of exposed adhesive of sufficient size and shape that an article placed in or over the area can be viewed through the area and the patch layer.

C1
(cont.)
27. A form with integrated fold-over card intermediate comprising:

a form layer having top and bottom surfaces and a periphery;

at least one die cut through the top and bottom surfaces of the form layer within the periphery of the form layer defining at least one portion of the form layer within the die cut;

a patch layer, having first and second halves, a periphery and top and bottom surfaces;

a layer of repositionable, peelable adhesive wherein the bottom surface of the first half of the patch layer is adhesively but removably secured to the top surface of the form layer over the entire die cut and the entire form layer portion;

an area of exposed adhesive attached to the patch layer within the card intermediate defined by a die cut within at least one of the form layer portions, the die cut defining a section of the form layer removable from the card intermediate;

the second half of the patch layer being a mirror image of the first half of the patch layer and the bottom surface of the second half of the patch layer being secured to the top surface of the form layer by the adhesive layer over neither the die cut nor the form layer portion; the patch layer, adhesive layer and form layer portion comprising the fold-over card intermediate;

wherein the adhesive layer has a greater affinity for the bottom surface of the patch layer than the top surface of the form layer such that when the fold-over card intermediate is removed from the form layer, the portion of the adhesive layer that is not between the patch

26/26

layer and the form layer portion is exposed and stays adhered to the bottom surface of the patch layer;

wherein the section of form layer is removable by peeling the section from the adhesive layer thereby creating the exposed area of the adhesive layer; and

C1
(cont.)
wherein the die cut is of a predetermined size and shape sufficient to make the area of exposed adhesive of sufficient size and shape that an article placed in or over the area can be viewed through the area and the patch layer.

wherein once removed from the form layer, the fold-over card intermediate can be folded in half, thus securing the first half and second half of the patch layer together by the adhesive layer and enclosing the form layer portion between the folded halves of the patch layer.

28. The form with integrated fold-over card intermediate of Claim 25 or 26 wherein the die cut defining the area of exposed adhesive is the same die cut that defines the form layer portion.
